

HOW TO PLANT

Planting sugar cane or sugarcane is a process that can be done in a few simple steps. Here are the basic steps:

Site Selection: Choose a site with sufficient sunlight and good soil drainage for planting sugarcane. Make sure the soil is soft and has enough nutrients.

Land Preparation: Clean the land by removing weeds and stones. You can also add organic fertilizers or compost to strengthen the soil.

Planting Preparation: Purchase cane seedlings from reliable nurseries or suppliers that sell this type of plant. Make sure the plants are healthy and in good condition.

Planting: Plant sugarcane crops between rows in your garden. Plant each piece of cane about 1.5 to 2 meters apart from each other.

Watering: After planting, water the plants to reach the soil and the roots. Make sure not to water too much to avoid stagnant water in your garden.

Care: Keep the garden area clean by removing weeds and unnecessary plants. Be sure to water and fertilize the garden regularly.

Cutting: When the plants grow and stem, they can be cut at the top, near the leaves. This is a way to facilitate harvesting and help strengthen the new stems.

Harvest Preparation: After 12 to 18 months, you can start harvesting sugarcane. Make sure the soil is sufficiently moist before starting to harvest.

This process can be a basic guide to growing sugar cane or sugarcane. It is also important to be careful in the care of your garden and follow the right care methods to achieve a good harvest.
